

AIAP Role Coding Manual

Operational guidance for R0-R6 AI roles and conditions

AIAP Release 6.5 | August 2026

Version-matched to the AIAP Core Working Paper v6.5 (Canonical Edition).

Contents

1. Purpose and boundary.....	3
2. Coding rules.....	3
3. Role definitions.....	3
4. Primary and secondary role selection.....	4
5. Ambiguous cases.....	4
6. Group and collaborative work.....	4
7. Reliability study.....	5
Appendix A. Minimum coding record.....	5

1. Purpose and boundary

R0-R6 is a designer-facing and teaching vocabulary. It is not a permission scale, misconduct ladder, or claim of increasing educational value. A role has authority only when it changes the evidence plan, validity risk, or learning claim. Students should not normally be required to self-code every workflow step.

2. Coding rules

1. Code the material claim before the tool behavior.
2. Record one primary role only when it drives the strongest evidence need.
3. Record secondary roles only when they materially change risk, evidence, or reflection.
4. Do not escalate evidence because a role sounds technologically advanced; escalate when the role changes the validity argument.
5. Where a workflow is ambiguous, preserve uncertainty and record the decision rule rather than forcing a neat chronology.

3. Role definitions

Role	Inclusion rule	Exclusion rule	Typical evidence implication
R0 Structurally excluded	AI access is materially constrained because independent performance is part of the claim.	Ordinary study or preparation support outside the controlled event is not R0.	Identity, access, control strength, accommodations, residual limitations.
R1 Tutor	AI explains, quizzes, scaffolds, or supports practice.	AI materially shapes the assessed artifact or judgement.	Usually light reflection when educationally relevant.
R2 Feedback partner	AI critiques student-created work and suggests changes.	AI creates the central content or performs the assessed decision.	Draft/feedback/revision rationale when claim-relevant.
R3 Tool	AI performs bounded procedural functions such as formatting, translation, code support, data cleaning, or visualization.	AI supplies the central analysis or conclusion.	Tool log and verification where the function is material.
R4 Generative co-production	AI generates substantial content under student direction.	The output is only an object of critique rather than part of the submitted product.	Representative workflow, source checks, human contribution, accountability.

Role	Inclusion rule	Exclusion rule	Typical evidence implication
R5 Object of critique	The assessed construct is evaluation, audit, correction, or comparison of AI output/process.	AI merely provides background support.	Captured outputs, criteria, errors, corrections, unseen audit.
R6 Agentic workflow	AI chains tools, automations, or agents across multiple task stages.	A single bounded tool call with no delegated workflow.	Workflow map, delegated functions, retained decision rights, stop/override points, independent verification.

4. Primary and secondary role selection

Select the primary role by asking which AI function most directly changes the inference, highest-weighted criterion, or strongest evidence burden. Secondary roles are recorded only when they independently affect evidence, risk, or student responsibility. One workflow may contain several roles; that does not create several lanes automatically.

5. Ambiguous cases

Case	Default coding	Reason
Translation of a report where language is not assessed	R3 secondary	Bounded procedural support; verify disciplinary meaning.
AI feedback followed by student revision	R2 primary	Feedback materially shapes revision decisions.
AI generates data interpretation that the student adopts	R4 primary	Central analytical content is co-produced.
Student audits a new AI output for bias and error	R5 primary	AI output is the object of assessed judgement.
Agent locates sources, cleans data, drafts and formats	R6 primary; R4 secondary	Multi-stage delegation controls the validity risk.
AI used to rehearse a viva	R1 or R2 preparation	Rehearsal is legitimate; unseen/changed challenge carries the authentication burden.

6. Group and collaborative work

Code the group workflow and each individual claim separately. A shared R4 or R6 artifact does not establish which person retained which decisions. When an individual claim is consequential, the evidence plan must preserve individual attribution through separate authentication, observed roles, decision logs, or another construct-valid route.

7. Reliability study

A pilot should use independently coded real workflows, a frozen manual, blinded coders, and preregistered agreement statistics. Compare R0-R6 with a simpler alternative. If the seven-role vocabulary does not improve evidence selection, communication, or programme mapping enough to justify burden, it should be simplified.

Appendix A. Minimum coding record

Field	Required content
Claim ID	Material claim affected by AI use.
Primary role	R0-R6 plus rationale.
Secondary roles	Only material secondary functions.
Evidence implication	What the coding changes in the evidence plan.
Uncertainty	Ambiguity, missing evidence, and alternative code.
Reviewer	Coder, date, manual version, adjudication if any.
